

1. Brainstorming & Ideation Phase

The brainstorming and ideation phase was carried out to identify the challenges faced by students, hobby writers, teachers, and content creators who want to turn their story ideas into comics. The primary focus was to develop a simple and intelligent solution that lets anyone, with or without drawing skills, create a complete illustrated comic story using Generative AI.

During brainstorming, several ideas were considered, including a story idea generator, an AI script writer that splits a story into panels, automatic panel image generation, consistent character creation, speech bubble and caption placement, multiple art styles, a comic layout and export tool, and a gallery of saved comics. The ideas were evaluated on usefulness, feasibility, ease of implementation, and relevance to the target users.

The main problem identified was that creating a comic requires several different skills at once: story writing, scripting, drawing, lettering, and page layout. Many people have good story ideas but cannot draw, and existing tools are either complex design software or generic image generators that do not keep characters consistent across panels or produce a structured story. Based on these observations, the concept of "ComicCraft: AI Comic Story Creator using Gemini Models" was proposed. The application combines story generation, panel scripting, AI image generation, speech bubble editing, and comic export in a single platform powered by Google Gemini models.

Key Ideas Identified

- **Story Idea Input:** the user enters a plot idea, genre, tone, art style, and number of panels.
- **AI Story and Script Generator:** Gemini converts the idea into a structured story with a title, characters, and a panel-by-panel script (scene description, dialogue, and caption).
- **Character Consistency:** character descriptions (appearance, clothing, personality) are stored and reused in every panel prompt so characters look alike across the comic.
- **Panel Image Generation:** a Gemini image generation model creates artwork for each panel in the chosen art style (manga, cartoon, superhero, watercolor, and so on).
- **Speech Bubble and Caption Editor:** dialogue and captions are overlaid on panels and can be edited, moved, and resized.
- **Regenerate and Edit:** users can regenerate a single panel or rewrite a scene without redoing the whole comic.
- **Comic Layout and Export:** panels are arranged into pages and exported as PDF or PNG.
- **Gallery and History:** saved comics, scripts, and character sheets are stored for later editing.

Final Ideation

After evaluating the ideas, the solution was finalized as ComicCraft, an assistant that goes beyond a simple image generator by providing a complete story-to-comic workflow with consistent characters and editable text. The overall concept can be represented as:

User Story Idea & Style Choices → Backend Processing → Gemini Text Model (Script) → Gemini Image Model (Panel Art) → Speech Bubbles & Layout → Finished Comic

Thus, the ideation phase established the core objectives, major features, target users, and overall direction of the ComicCraft project.
